Hello,

I am applying for the Lead Engineer role at Halter, Relocate to New Zealand. I live in Sri Lanka and I want to move to Auckland. I can work from the office, and I am happy to spend time on farms. I will need visa support for the move.

I have 10 years in software. Backend is the base, and I have worked as a tech lead for the last few years. At Aventude I lead backend engineering for Norwegian government and municipal products. The services are Java and Spring Boot. On Compose I cut a critical API from about 10 seconds to under 400ms. I also built a legal chatbot in Python and LangGraph that answers from law and regulatory handbooks. Most of the work after the first version was retrieval, hybrid search and reranking, and an eval pipeline so we could see a worse answer before it went out.

Before that I was a staff engineer and tech lead at Circles.Life. The platforms serve 150M+ users. I led zero-downtime go-lives for ONIC, AT&T and Telkomsel. We cleared the main database bottlenecks and slow APIs, put New Relic and Grafana on the services, and then had no P1 or P2 for six months on what I owned.

In a lead role I still write the code. I do the design with the team, break the work down, review it, and follow it through the release. I have worked with product owners from a rough requirement through to something we could ship. When production breaks, I stay on it until it is fixed.

My main stack is Java, Spring Boot and Python. I build REST APIs and microservices, and I use PostgreSQL, MySQL, MongoDB and Redis. Cloud is AWS and Azure, with Kubernetes. I am an AWS Certified Solutions Architect (associate). I have also shipped work in Scala, React, C# and small Node.js scripts. I use AI tools every day to get through the slower parts of the job. I have shipped LLM features to users as well, the legal chatbot and a form-and-workflow assistant that removed manual configuration. We ran evals on those before release.

I have not worked in agriculture. I have learned a domain and then shipped in it before: core banking, telecom, and now government software. I also built Smart Shoes, an AI and IoT product for visually impaired people. It had to work while someone was out using it. That is the closest I have come to software that sits on hardware in the real world.

Let me know if you want to talk.
